## 1. Overview

Research Question: How can we generate plausible high-fidelity counterfactuals of real data, and how do we evaluate them?

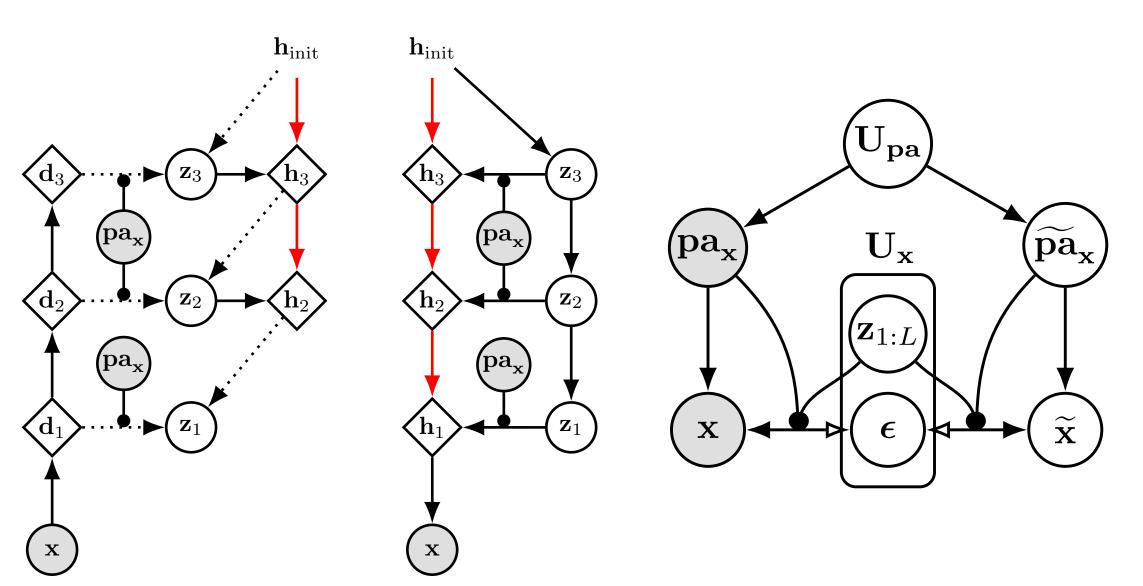

### **Motivation:**

- ► Counterfactuals are useful for explainability, data aug., fairness etc
- ► High fidelity counterfactuals of **structured variables** are challenging
- ► Identifiability guarantees are absent in the general case
- ► Prior work is mostly theoretical, we take a pragmatic approach

### **Contribution:**

- ► Hierarchical causal mechanisms for high-dim structured variables
- ► Latent mediator model for direct, indirect and total effect estimation
- ► Counterfactual training to mitigate ignored counterfactual conditioning
- ► Demonstrate the axiomatic soundness of our inferred counterfactuals

## 2. Causal Mechanisms: Hierarchical VAEs

(a) Inference Model

(b) Generative Model

(c) Exogenous Prior:  $p_{ heta}(\mathbf{z}_{1:L})$ 

**Figure:** Twin network of our deep SCM (c) induced by an exogenous prior (b), where  $z_{1:L}$  is part of x's exogenous noise  $U_x$ . Directly compatible with Pawlowski et al. (2020)'s framework.

**Abduction:** 

$$\mathbf{z}_{1:L} \sim q_{\phi}(\mathbf{z}_{1:L} \mid \mathbf{x}, \mathbf{pa_x})$$

$$\boldsymbol{\epsilon} = h^{-1}(\mathbf{x}; g_{\theta}(\mathbf{z}_{1:L}, \mathbf{pa_x})) = \frac{\mathbf{x} - \boldsymbol{\mu}(\mathbf{z}_{1:L}, \mathbf{pa_x})}{\boldsymbol{\sigma}(\mathbf{z}_{1:L}, \mathbf{pa_x})}$$

- ightharpoonup Action<sup>†</sup>:  $do(\mathbf{pa_x} \coloneqq \widetilde{\mathbf{pa_x}})$
- Prediction:

$$\begin{split} \widetilde{\mathbf{x}} &\sim p_{\theta}(\widetilde{\mathbf{x}} \mid \mathbf{z}_{1:L}, \widetilde{\mathbf{pa}}_{\mathbf{x}}) \\ &= h(\boldsymbol{\epsilon}; g_{\theta}(\mathbf{z}_{1:L}, \widetilde{\mathbf{pa}}_{\mathbf{x}})) = \boldsymbol{\mu}(\mathbf{z}_{1:L}, \widetilde{\mathbf{pa}}_{\mathbf{x}}) + \boldsymbol{\sigma}(\mathbf{z}_{1:L}, \widetilde{\mathbf{pa}}_{\mathbf{x}}) \odot \boldsymbol{\epsilon} \end{split}$$

 $^{\dagger}$ Counterfactual parents  $\widetilde{pa}_{x}$  are a result of upstream interventions on the associated causal graph.

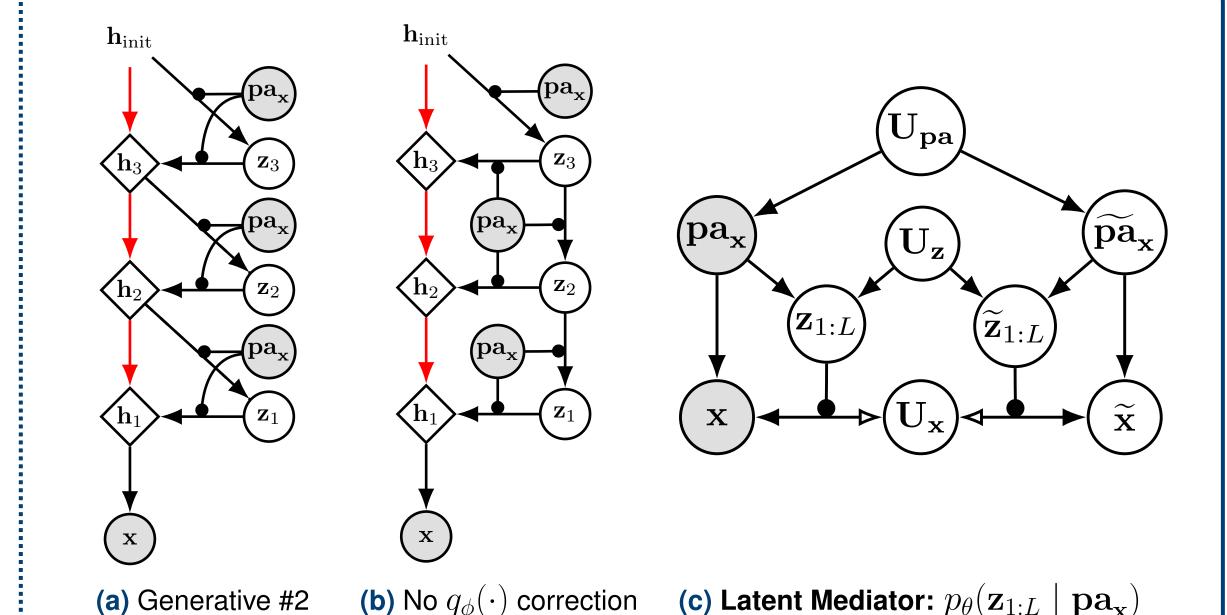

Figure: Twin network of our latent mediator SCM (c), induced by a conditional prior (a-b). Here,  $z_{1:L}$  becomes a **latent mediator** due to its dependence on endogenous variables  $pa_{x}$ .

► Abduction:

$$\forall i : \mathbf{z}_i \sim q_{\phi}(\mathbf{z}_i \mid \mathbf{z}_{>i}, \mathbf{x}, \mathbf{pa_x}) = \boldsymbol{\mu}_i^q(\mathbf{z}_{>i}, \mathbf{pa_x}) + \boldsymbol{\sigma}_i^q(\mathbf{z}_{>i}, \mathbf{pa_x}) \odot \mathbf{U_{\mathbf{z}_i}}$$
$$\mathbf{U_x} = h^{-1}(\mathbf{x}; g_{\theta}(\mathbf{z}_{1:L}, \mathbf{pa_x})) = (\mathbf{x} - \boldsymbol{\mu}(\mathbf{z}_{1:L}, \mathbf{pa_x})) \oslash \boldsymbol{\sigma}(\mathbf{z}_{1:L}, \mathbf{pa_x})$$

- ightharpoonup Action:  $do(\mathbf{pa_x} := \widetilde{\mathbf{pa_x}})$
- Prediction:

$$\forall i : \widetilde{\mathbf{z}}_{i} \sim \pi \cdot p_{\theta}(\mathbf{z}_{i} \mid \mathbf{z}_{>i}, \widetilde{\mathbf{pa}}_{\mathbf{x}}) + (1 - \pi) \cdot q_{\phi}(\mathbf{z}_{i} \mid \mathbf{z}_{>i}, \mathbf{x}, \mathbf{pa}_{\mathbf{x}}) \qquad (\text{approx.})$$

$$= \boldsymbol{\mu}_{i}^{r}(\widetilde{\mathbf{z}}_{>i}, \widetilde{\mathbf{pa}}_{\mathbf{x}}) + \boldsymbol{\sigma}_{i}^{r}(\widetilde{\mathbf{z}}_{>i}, \widetilde{\mathbf{pa}}_{\mathbf{x}}) \odot \mathbf{U}_{\mathbf{z}_{i}}$$

$$\widetilde{\mathbf{x}} = h(\mathbf{U}_{\mathbf{x}}; g_{\theta}(\widetilde{\mathbf{z}}_{1:L}, \widetilde{\mathbf{pa}}_{\mathbf{x}})) = \boldsymbol{\mu}(\widetilde{\mathbf{z}}_{1:L}, \widetilde{\mathbf{pa}}_{\mathbf{x}}) + \boldsymbol{\sigma}(\widetilde{\mathbf{z}}_{1:L}, \widetilde{\mathbf{pa}}_{\mathbf{x}}) \odot \mathbf{U}_{\mathbf{x}}$$

## 3. Causal Mediation Analysis

► The study of how a treatment effect is **mediated** by another variable, to help explain why or how an individual may respond to certain stimulus.

Estimating **Direct** (DE), **Indirect** (IE) and **Total** (TE) causal effects<sup>†</sup>:

$$DE_{\mathbf{x}}(\widetilde{\mathbf{pa}}) \coloneqq \mathbb{E}\left[g_{\theta}(\widetilde{\mathbf{pa}}_{\mathbf{x}}, \mathbf{z}_{1:L}) - g_{\theta}(\mathbf{pa}_{\mathbf{x}}, \mathbf{z}_{1:L})\right]$$

$$IE_{\mathbf{x}}(\widetilde{\mathbf{z}}_{1:L}) \coloneqq \mathbb{E}\left[g_{\theta}(\mathbf{pa}_{\mathbf{x}}, \widetilde{\mathbf{z}}_{1:L}) - g_{\theta}(\mathbf{pa}_{\mathbf{x}}, \mathbf{z}_{1:L})\right]$$

$$TE_{\mathbf{x}}(\widetilde{\mathbf{pa}}, \widetilde{\mathbf{z}}_{1:L}) \coloneqq \mathbb{E}\left[g_{\theta}(\widetilde{\mathbf{pa}}_{\mathbf{x}}, \widetilde{\mathbf{z}}_{1:L}) - g_{\theta}(\mathbf{pa}_{\mathbf{x}}, \mathbf{z}_{1:L})\right]$$

†Identifiability assumptions: sequential ignorability (Imai et al., 2010); iVAE setup (Khemakhem et al., 2020).

Khemakhem et al. Variational Autoencoders and Nonlinear ICA: A Unifying Framework. AISTATS 2020.

## 4. Counterfactual Training

► A technique for improving **axiomatic effectiveness** of counterfactuals.

$$I(\widetilde{\mathbf{pa}}_k; \widetilde{\mathbf{x}}) \ge \mathbb{E}_{p(\widetilde{\mathbf{pa}}_k, \widetilde{\mathbf{x}})} \left[ \log q_{\psi}(\widetilde{\mathbf{pa}}_k \mid \widetilde{\mathbf{x}}) \right] - H(\widetilde{\mathbf{pa}}_k)$$

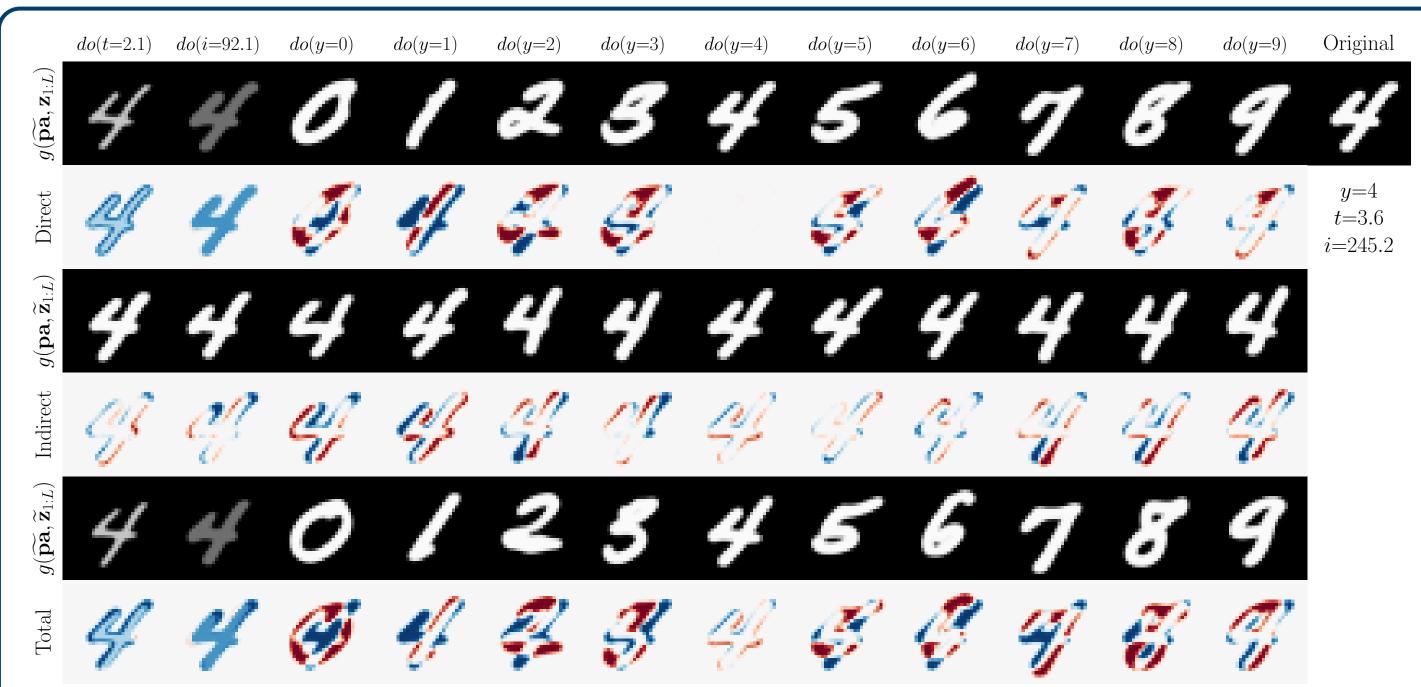

Our constrained optimization objective:

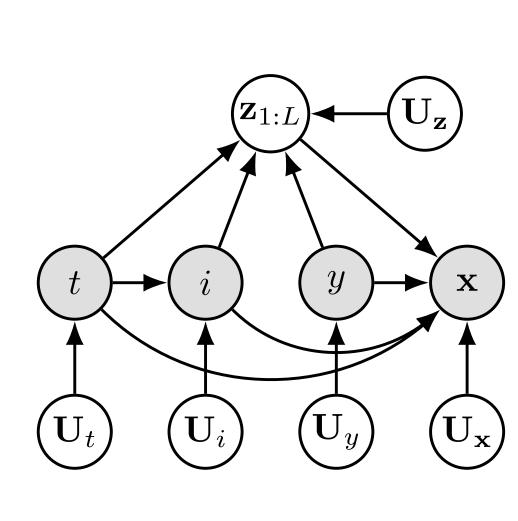

$$\underset{\theta,\phi}{\arg\min} \, \mathbb{E}_{p_{\text{data}}(\mathbf{x},\mathbf{pa_x})} \left[ \mathcal{L}_{\text{CT}}(\mathcal{M}; \mathbf{x}, \mathbf{pa_x}) \right] \qquad \text{s.t. } \mathcal{F}_{\text{FE}}(\theta, \phi; \mathbf{x}, \mathbf{pa_x}) \le c,$$

$$\mathcal{L}_{\mathrm{CT}}(\mathcal{M}; \mathbf{x}, \mathbf{pa}_{\mathbf{x}}) = -\sum_{k} \mathbb{E}_{\widetilde{\mathbf{pa}}_{k} \sim p(\mathbf{pa}_{k}), \widetilde{\mathbf{x}} \sim P_{\mathcal{M}}(\widetilde{\mathbf{x}}|do(\widetilde{\mathbf{pa}}_{k}), \mathbf{x})} \left[\log q_{\psi_{k}}(\widetilde{\mathbf{pa}}_{k} \mid \widetilde{\mathbf{x}})\right]$$

## 5. Morpho-MNIST

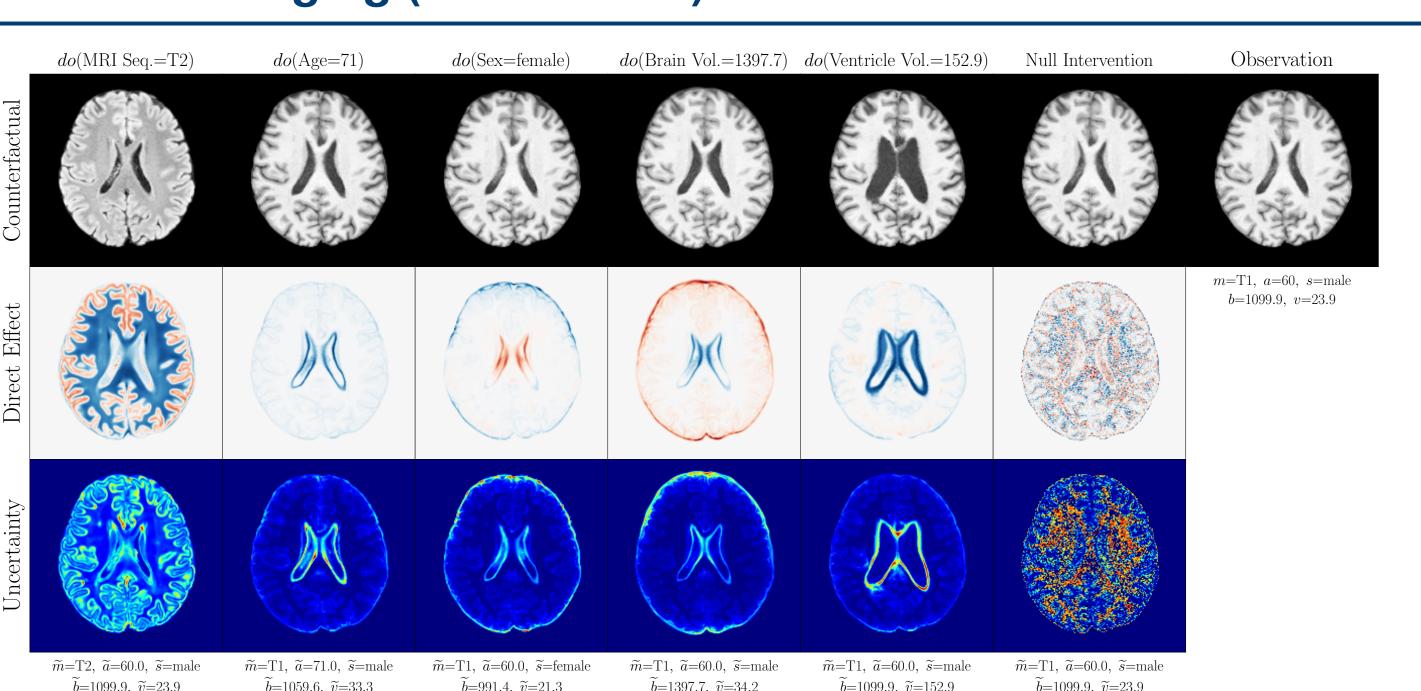

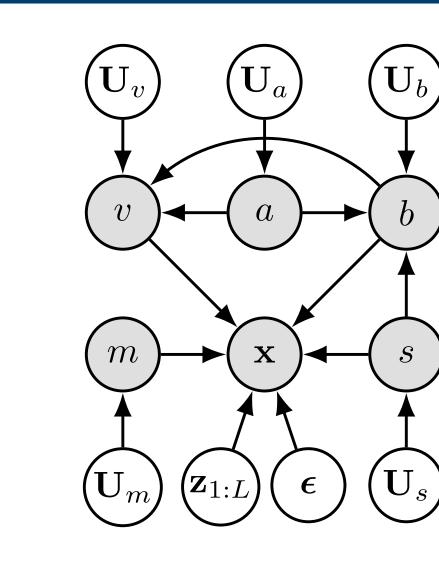

(a) Latent mediator SCM used for the Morpho-MNIST dataset. The observed variables are: image  $(\mathbf{x})$ , digit (y), stroke thickness (t) and pixel intensity (i).

Figure: Morpho-MNIST counterfactuals from our latent mediator SCM. Direct, indirect and total causal effects are shown (red: increase, blue: decrease). **Cross-world counterfactuals** (row 3) are the potential outcome of x given  $pa_x$  and the counterfactual mediator  $\tilde{z}_{1:L}$  we could've observed had  $pa_x := \tilde{pa}_x$ .

## 6. Brain Imaging (UK Biobank)

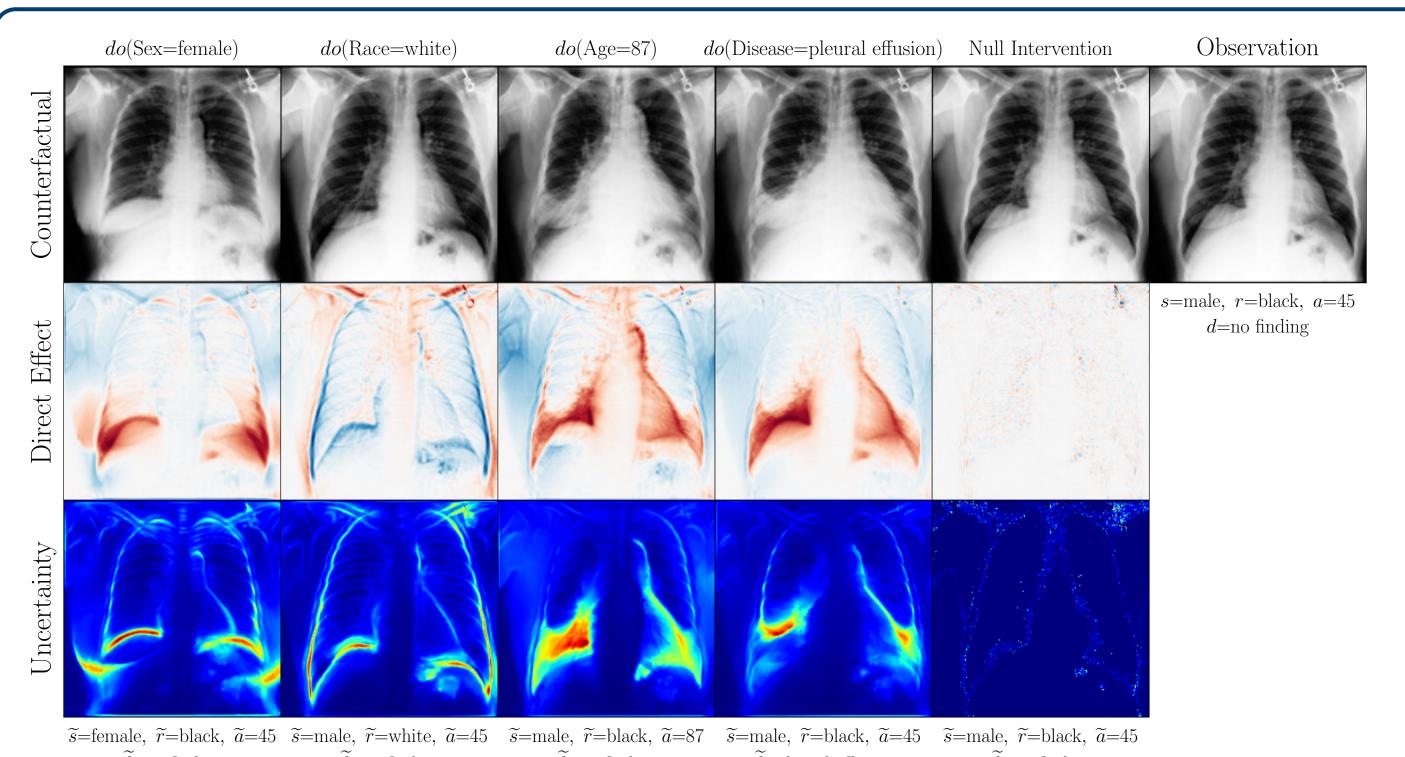

(a) Deep SCM used for UK Biobank. Variables: MRI Seq. (m), age (a), sex (s), brain (b) and ventricle (v) volume.

Figure: Brain MRI counterfactuals from our SCM (exogenous prior). Subject identity is preserved. Counterfactual uncertainty from stochastic abduction.

## 7. Chest X-ray (MIMIC)

 $\left(\mathbf{U}_{d}\right)$ 

(a) Deep SCM used for MIMIC-CXR. The observed variables in the causal graph are: age (a), sex (s), race (r), disease (d) and chest x-ray (x). The disease studied is pleural effusion.

Figure: Chest X-ray counterfactuals from our SCM. Localized interventional changes which respect the causal graph (a) and preserve subject identity.
